

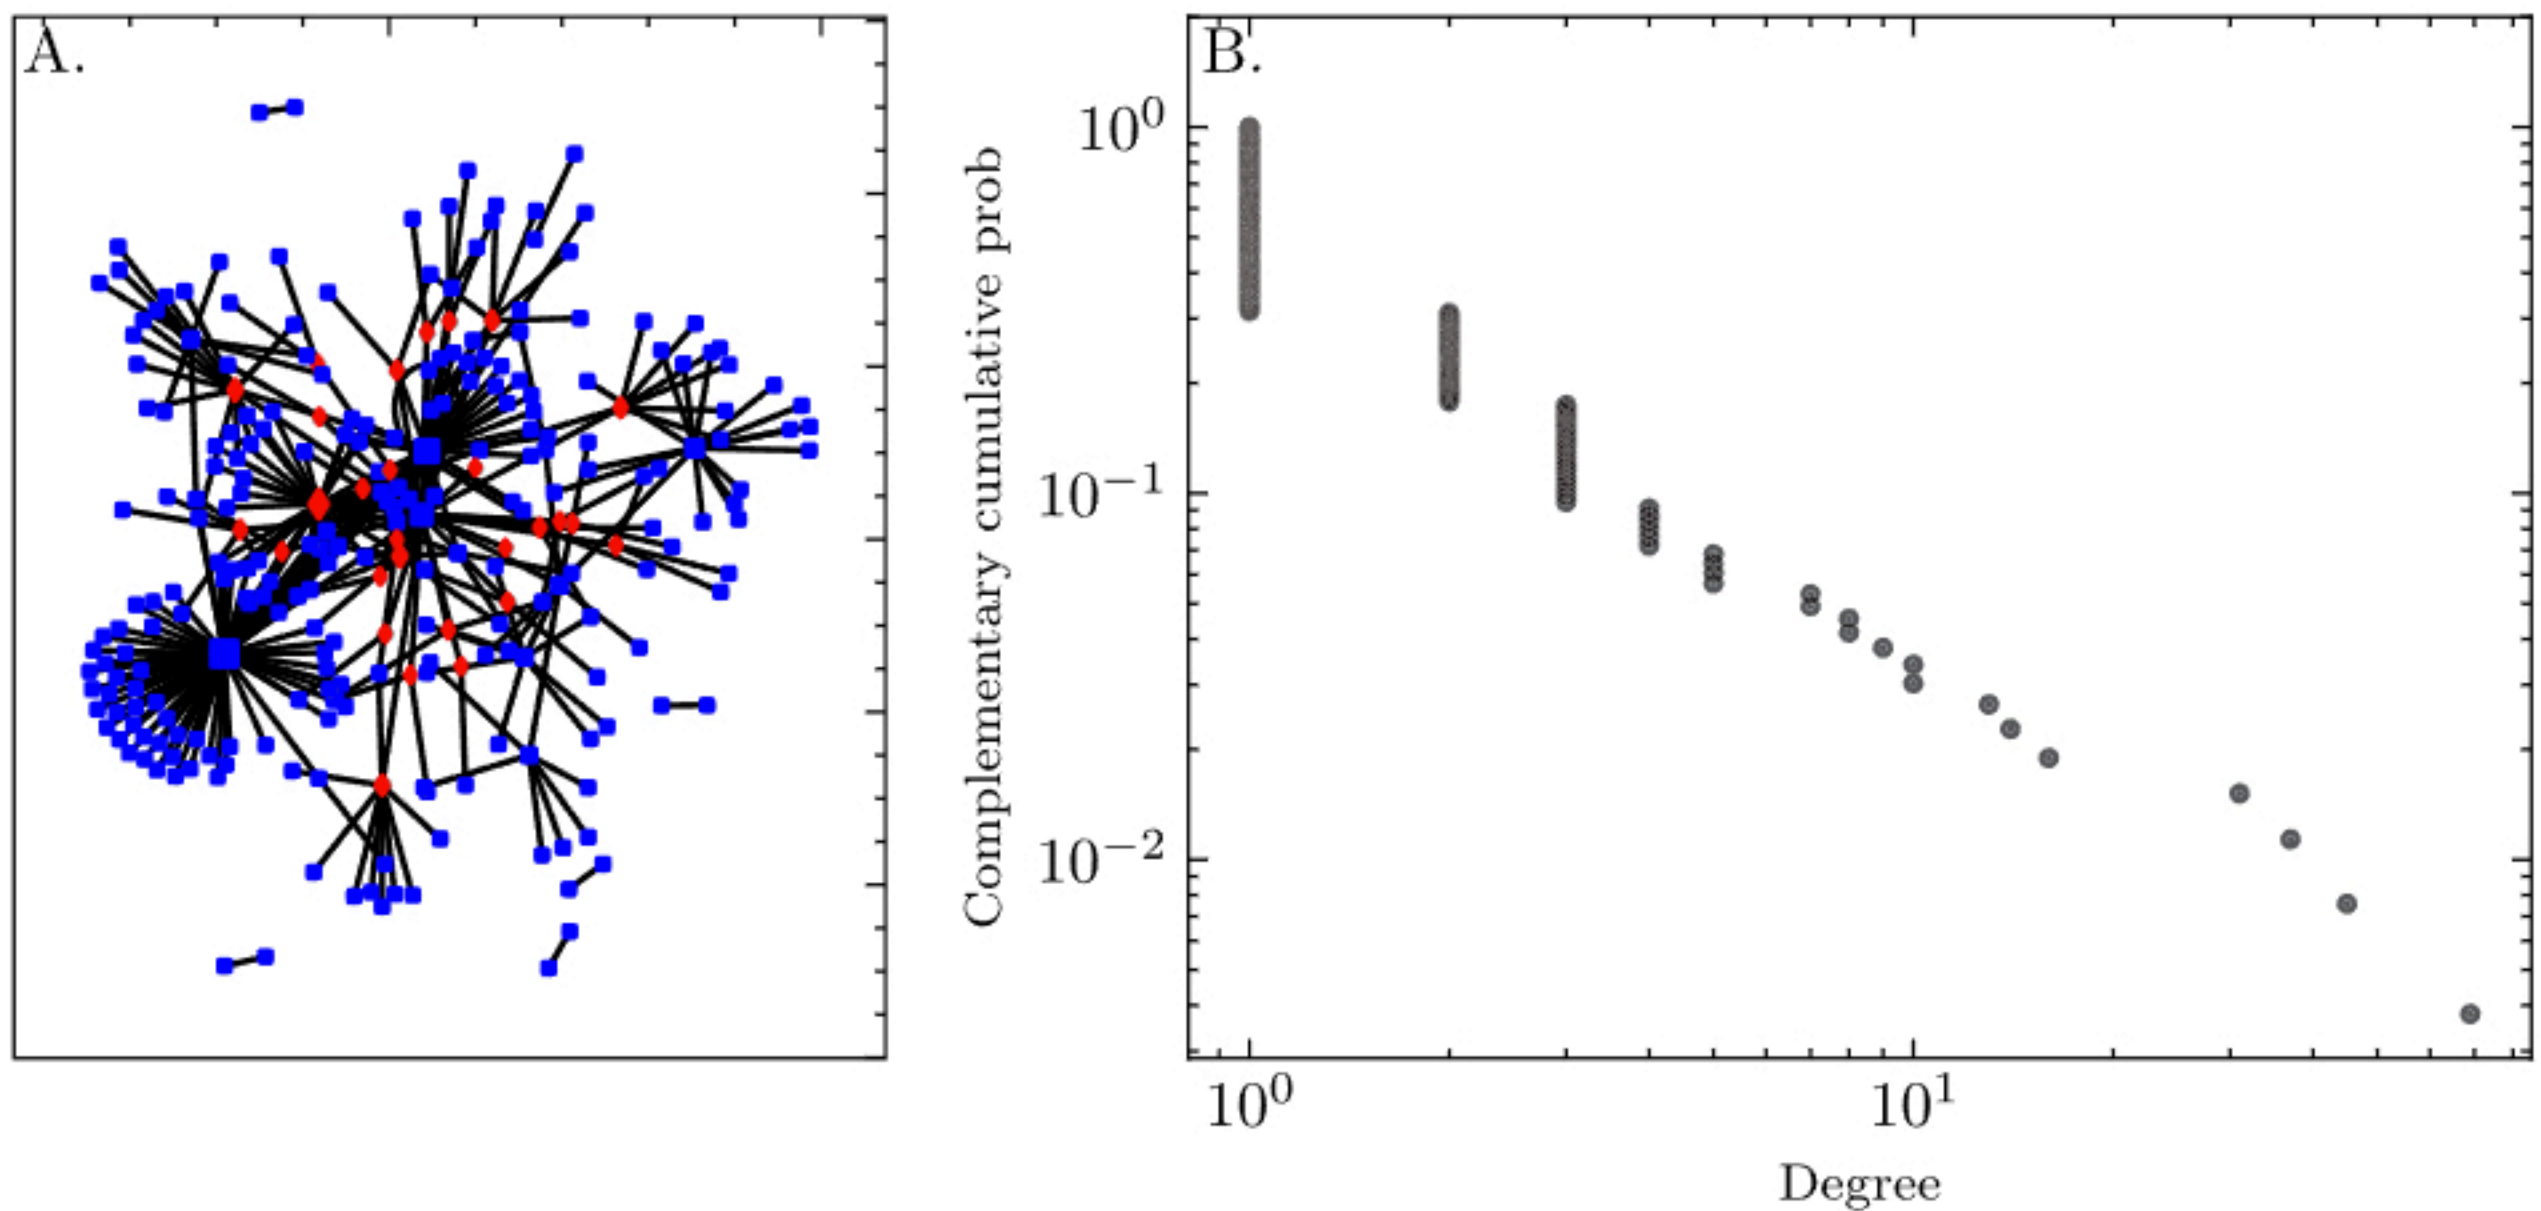

Figure 2. (A) The Watermelon Meow Meow (WMM) contact network that was generated by a single class of 32 students at a single institution. Squares/Diamonds (called nodes) indicate a student, staff, or administrator at the institution and a black line connects two nodes if one individual infected another with the fictitious WMM pathogen. Red diamonds denote students in the Spring course and Blue squares denote any student, staff, administrator not in the course. The area of the blue squares is proportional to the number of connections in the network. (B) The complementary cumulative density of the degree distribution. The degree distribution is presented to students as one way to characterize a random network.
