

FIG. 5. The CAP algorithm (orange) outperforms a non-CAP (blue) for an equally weighted (dashed line) and adaptive (solid line) weighted ensemble. Performance metrics are aggregated across region and for the two-week ahead "Nowcast" prediction. (A.) The median, 10 and 90, 25 and 75th percentiles of logscores. (B.) Cumulative density function of probability integral transform (PIT) values. (C.) Brier scores computed by partitioning forecasts above and below a sequence of ILI "cutpoints" from 0 to 10. (D.) Logscore is presented on the vertical axis and the number of weeks before and after the peak ILI.
